

Ideation Phase

Brainstorm & Idea Prioritization

Date	October 3, 2026
Team ID	SWTID-2026-7450
Project Name	Import Data using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Project Ideation

The team focused on improving employee-data management in ServiceNow by reducing manual spreadsheet entry, maintaining data accuracy, preventing duplicate records, and making the import process structured and repeatable.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Problem Statement: Manual entry of employee information into ServiceNow can be time-consuming and may lead to duplicate or inconsistent records. The team selected a spreadsheet-based import solution using ServiceNow Import Sets and Transform Maps to automatically map employee data to the required target fields.

Step-2: Brainstorm, Idea Listing and Grouping

Idea / Area	Proposed Approach
Spreadsheet Preparation	Prepare employee data with Employee ID, Employee Name, Email, Department and Location.
Import Set Table	Use a temporary staging table to store spreadsheet records before transformation.
Employee Test Table	Create the target custom table with the required employee fields.
Transform Map	Map source fields from Employee Import to the corresponding Employee Test fields.
Data Transformation	Run Transform to insert new employee records or update existing records.
Coalesce	Use Employee ID as the unique field to prevent duplicate employee records.
Validation	Check transform history and verify inserted, updated and ignored records.

Step-3: Idea Prioritization

Priority	Idea	Importance	Reason
1	Spreadsheet + Import Set	Essential	Provides the source and staging process for employee data.
2	Transform Map	Essential	Transfers source data into the Employee Test table.
3	Coalesce	High	Prevents duplicate records and updates existing employees.
4	Validation / Transform History	High	Confirms whether records were inserted, updated or ignored.
5	Reports and Dashboard	Extension	Provides visibility into employee data and import activity.

Proposed Implementation

- Create the employee spreadsheet with the required fields.
- Create the Employee Test custom table in ServiceNow.
- Load spreadsheet data into the Employee Import Set Table.
- Create the Transform Map named 'Sample Spreadsheet Import'.
- Map Employee Import fields to Employee Test fields and run Transform.
- Enable Coalesce on Employee ID to prevent duplicate records.
- Repeat an import to verify that existing records are updated and unchanged records are ignored.

Expected Result

Employee records are successfully imported into the Employee Test table. Existing records are updated when the same Employee ID is imported with changed information, while new Employee IDs create new records. Re-importing unchanged data does not create duplicate records.
